What is Computer Vision?

“Computer vision is a field of artificial intelligence that enables systems to understand and interpret the content of digital images and videos.”

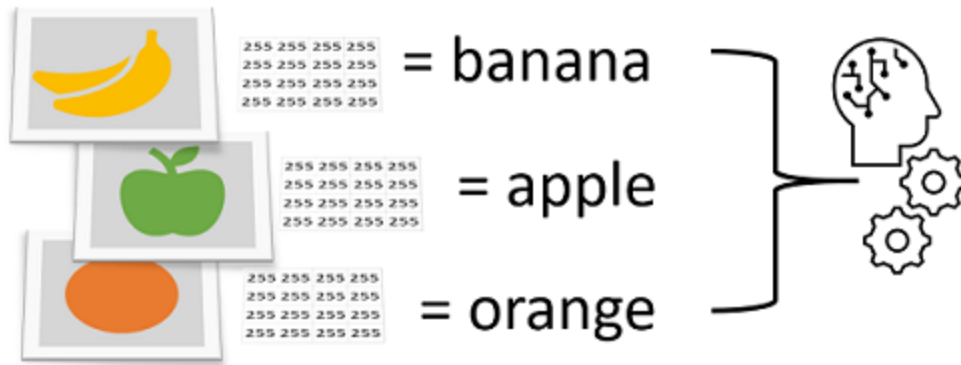

How can a system “see” ?

Applications of Computer Vision

Object Classification

- Image classification is used to determine the main subject of an image

Applications of Computer Vision

Object Detection

- Object detection builds upon image classification and is used to find individual objects and their locations in an image.

Applications of Computer Vision

Semantic Segmentation

- Classifies individual pixels in an image to the object with which it belongs – providing a Mask/Outline of detected objects.

Object detection

Semantic segmentation

Applications of Computer Vision

Image Analysis

- Extracts information from the entire scene of an image.

Cows grazing in a field

Applications of Computer Vision

Face detection, analysis, and recognition

- Specialized form of object detection that identifies faces in an image.

Applications of Computer Vision

Optical Character Recognition (OCR)

- Detects and reads text in images.
